
Individual Assignment 03

Level: 06

COMP60022

Decision Analytics

Batch Code/s: HF2561COM

Hand Out Date: As specified in the SAIS

Hand In Date: As specified in the SAIS

Pramishka Kannangara CB012466

INSTRUCTION TO CANDIDATES:

1. Students are advised to underpin their answers with the use of references (cited using the Harvard Name System of Referencing).
2. Late submission will be awarded zero (0) unless Exceptional Circumstances (EC) are upheld.
3. We draw your attention to the [Academic Conduct](#) Procedure to encourage good academic practice.
4. Assignment presentation and modeling work should be submitted as a softcopy

1. Introduction

1.1 System Overview

SurveyPro is an online-based survey management system that will support the creation, distribution, and analysis of online surveys in a highly scalable and efficient manner. The system will be able to facilitate organizations and individuals in designing dynamic surveys, gathering responses via public links and private email invitations, and understanding such responses by real-time analytics dashboards. Built on a modern web technology stack coupled with a NoSQL database architecture, SurveyPro supports flexible data structures, automation features, and high-volume response handling that make it suitable for data-driven decision-making environments.

1 Home Page

1.2 Problem Statement

Typical survey systems are usually afflicted with rigid database schemata, scalability issues, and late analytics, which in essence hamper the efficiency with which dynamic question structures and a high volume of responses are managed. Most existing platforms currently also lack real-time automation features in analytics, automated invitations, reminders, and response tracking, thereby increasing administrative overhead and reducing response rates. Besides that, secure access control, supporting anonymous and public participation, is considered an open challenge. The described limitations justify the necessity for a flexible, scalable, and automated survey platform able to provide timely insights.

1.3 Objectives of the System

The main objective of SurveyPro is to construct a scalable and flexible survey platform, which allows dynamic survey structures and high-volume response gathering based on a NoSQL database.

This system plans for the automation of key business processes: the invitation process, saving responses, updating analytics, and notifications, which reduce human effort spent. Another goal is to make available to customers in-depth detection and analytics, such as completion rates and drop-off analysis, and device detection to interpret the data better. Consequently, this platform is designed to provide secure access control that will support both private and public surveys, delivering a robust yet easy-to-use solution for survey management.

2. Technology Stack and Justification

2.1 Frontend Technology Selection

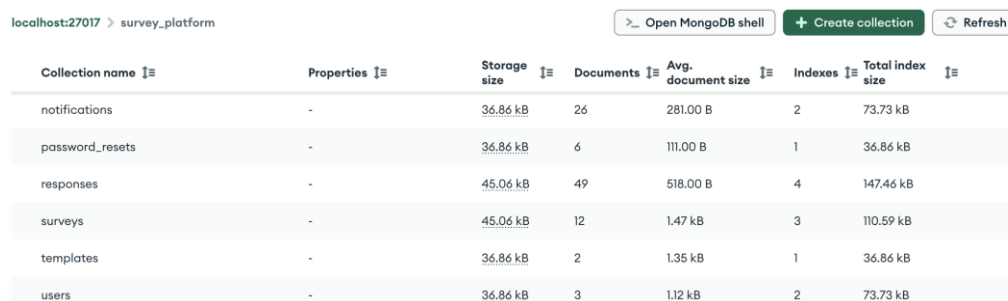

The components of the user interface of SurveyPro are also able to accommodate various screen sizes and are implemented on the frontend by using HTML5, CSS3, and JavaScript along with Bootstrap 5, without being shy about using AJAX in the background. Reactive basic functionality using jQuery will also be implemented to display progress bars and timers of the survey in a state of liveliness, dynamic refreshing of contents, and display questions according to the responses from users without reloading pages. Consistent with this emphasis on creating a software design strategy, it emphasizes keeping development at the forefront, the interface being responsive to mobile devices, and interactive with users.

2.2 Backend Technology Selection

The backend will be powered by Flask-Python, a lightweight web framework that, put together with modularity, allows me to easily build RESTful API controls along with abstract server-side automation. Furthermore, it extends this with ease of integration with any background scheduler like APScheduler. Compatibility with asynchronous operations further helps in the implementation of features like auto-save, live analytics, and even automated emails. Rich Python ecosystem, it also allows easy integrations with PDF generation libraries, data visualization, and authentication.

2.3 Database Technology Selection

SurveyPro leverages MongoDB, a document-based NoSQL system. Surveys, users, password_resets, responses, templates, and notifications are collection-based and are generally designed to work perfectly in a schema-less environment. MongoDB's high scalability and high capacity to deal with high-throughput writes make it perfect for SurveyPro. MongoDB supports nested documents, which are crucial when dealing with survey systems.

Collection name	Properties	Storage size	Documents	Avg. document size	Indexes	Total index size
notifications	-	36.86 kB	26	281.00 B	2	73.73 kB
password_resets	-	36.86 kB	6	111.00 B	1	36.86 kB
responses	-	45.06 kB	49	518.00 B	4	147.46 kB
surveys	-	45.06 kB	12	1.47 kB	3	110.59 kB
templates	-	36.86 kB	2	1.35 kB	1	36.86 kB
users	-	36.86 kB	3	1.12 kB	2	73.73 kB

2 MongoDB Collections

2.4 Justification for NoSQL (MongoDB)

In addition, MongoDB is more preferable than using a relational database management system due to its flexibility in allowing a wide range of questions in a survey with diverse responses, scalability in managing a wide number of surveys simultaneously, and efficiency in reading and writing from it in a fast manner in order to accommodate real-time analytics with auto-save features (IBM, 2021). Moreover, the advantages of using MongoDB as opposed to survey data analysis include its flexibility in supporting nested surveys with questions and answers in nested documents, allowing aggregation operations in order to compute various parameters.

2.5 Third-Party Services and Libraries

The system shall be made up of other support tools/libraries, which shall be used to improve the system functionality and user experience. For example, the system shall make use of the Flask-Mail library in the sending of automated emails such as surveys, password, etc. Additionally, the system shall make use of the APScheduler library in the expiring of surveys as well as sending automated notifications. In addition, the system shall make use of the Google Translate library in order to support the global community, having multiple languages in the translation of surveys carried out through the system (W3schools.com, 2026). Finally, the Survey Analytics feature will utilize Chart.js in presenting the analytics related to surveys in the form of charts and graphs. Similarly, ReportLab will be utilized in generating reports in PDF format related to exported surveys in the system. In addition, the User Agents library will be used in detecting user analytics related to devices and browsers used by people in participating in surveys conducted by the system. Finally, Bootstrap icons and fonts will be used in enhancing the overall UI and UX of the system by incorporating new-age icons and fonts into the system design itself.

3. NoSQL Database Characteristics

3.1 Schema less Data Modeling

The system uses a schema-less data modeling, which means that it can easily adapt and change without requiring changes to databases that contain the data structure or model that surveys possess. This is very important, especially for a system like this that handles surveys, each of which has various types of questions, rules, and some form of metadata. The schema-less nature allows rapid development and smooth feature extension or customization.

3.2 Document Oriented Storage

MongoDB uses JSON-like documents, and this type of data structure fits perfectly, especially since it is similar to that used by a survey, and a survey is a hierarchical form of data (GeeksforGeeks, 2022). The data structure provides space for inclusion of metadata related to the survey, definitions related to questions, and other attributes that could be perfectly sustained within a document, improving data retrieval from the database, especially during perform read operations.

3.3 Flexible Data Structures

This platform can also benefit from the flexible document structure of MongoDB and can include flexible arrays and object nesting. For example, different types of answers, such as text responses, rating systems, multiple-choice systems, etc., might be included for a survey conducted through this platform.

3.4 Indexing Strategy

Indexing is also leveraged optimally, e.g., indexes are made to columns that are often targeted for queries, such as survey ids, user ids, invitation tokens, and time stamps. Compound indexes can also be used to optimize queries for analytical purposes for survey status, responses, and time ranges. In doing so, it balances storage overheads and write efficiencies optimally. (Akhil Padmanaban, 2025).

4. System Architecture Overview

4.1 High Level Architecture

The system uses a client-server architecture, and there is a sharp division between the client and server pieces. The users interact with a webpage, which is a web-based interface for human users. All processing and data handling, along with business logic, lie on the server side. This goes a long way in ensuring reliability and also enables scalability because as the user base increases, so does the number of surveys being filled.

The system architecture also supports the functionality of public surveys that can be reached via common links, and it does support personal surveys sent via e-mail invitations. User management operations, such as password reset via e-mail, are provided in the system but are not considered part of the basic components.

4.2 Client Server Interaction

The client side is the part of the system that users can view and use, like the survey form, dashboard, etc. For example, users wanting to create surveys, complete surveys, and wanting to reset their passwords will result in sending a request to the server from the client.

Next, these requests are executed by the server, which in turn involves checking validation rules during execution, checking for permissions for the particular survey, storing data as needed. The data obtained from processing in the server is then forwarded to the client, along with proper formatting so that it can be easily displayed for the user. It is in a safe state during this time in the server.

4.3 Data Flow Between Components

Data flow within the system occurs in a logical manner. This means that, when a survey is created or edited, the data transfer occurs from the client to the server to the database. In the same way, the responses that the attendees to the survey send are also transferred in the same manner.

For private surveys, it is done through details and links using email services, while for public surveys, it is done through links. Thus, at every stage, it is confirmed that accurate processing of data and authorized access to users are carried out.

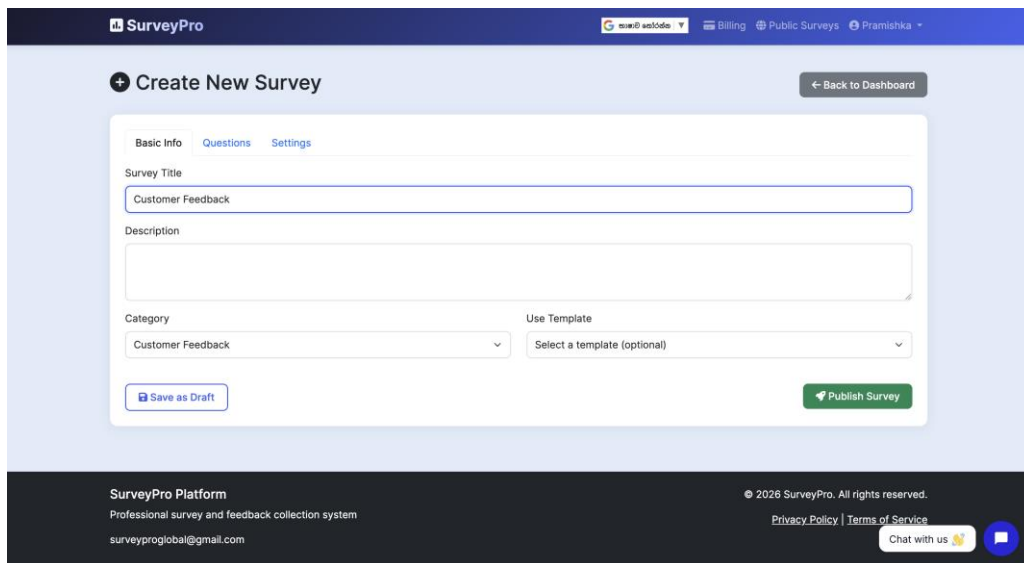

5. Core System Features

5.1 Survey Management

Another important aspect of this particular tool is that it includes the facility to manage the survey done by various users. This particular facility can be utilized to design, manage, and use the survey. In this context, it includes providing the survey to various individual members of society or to the public at large through emails and web links, respectively. This helps in providing various facilities in an easy manner.

5.1.2 Survey Creation

It provides users with an easy to use interface to create a survey, where the survey title, description, and question set can be defined. Several types of questions are supported, including multiple-choice and short text responses. Changes and edits are possible before publishing, thus preventing most mistakes and ensuring improved data quality.

The screenshot shows the 'Create New Survey' page in the SurveyPro platform. The page has a dark blue header with the SurveyPro logo and navigation links like 'Billing', 'Public Surveys', and 'Pramishka'. Below the header, there's a light blue section with a '+ Create New Survey' button and a 'Back to Dashboard' link. The main form is divided into three tabs: 'Basic Info', 'Questions', and 'Settings'. The 'Basic Info' tab is active, showing fields for 'Survey Title' (with 'Customer Feedback' entered), 'Description' (a large text area), 'Category' (a dropdown menu with 'Customer Feedback' selected), and 'Use Template' (a dropdown menu with 'Select a template (optional)' selected). At the bottom of the form are two buttons: 'Save as Draft' and 'Publish Survey'. The footer contains the 'SurveyPro Platform' logo, contact information, copyright notice, and links to 'Privacy Policy' and 'Terms of Service', along with a 'Chat with us' button.

5.1.3 Survey Configuration

As the user configures their survey, they will have the option of making the survey public or private in nature. If the user makes the survey public in nature, it will have its own unique shareable URL that can be shared freely with the public at large. On the other hand, making the survey private in nature allows the user to enter the email addresses of expected participants, and the system will automatically send an email. Other configurations, like saving the survey as a draft and enabling multiple responses, can be used to influence access and participation.

5.2 Question Management

The management of questions enables survey creators to select templates and organize the questions that are included within a survey. This system supports a variety of questions, and users can use it to obtain structured and unstructured responses. In addition, survey questions can be added, changed, and rearranged, and this can be done fairly easily. This will assist improving the clarity of the questions within a survey, increasing the data collected.

This system also improves consistency and accuracy while creating questions through functionality that enables users to review their questions. When it comes to consistency and accuracy while the survey is active, question settings enhance this feature by discouraging modifications to the data. The feature to manage questions in surveys is thus useful with regards to customisations.

The screenshot displays a user interface for managing survey questions. At the top, it says 'Questions (9)' and has a 'Drag to reorder' button. Below are four question cards, each with a question ID, text, type, options, and action buttons (edit, delete, reorder).

- Q1** How satisfied are you with your current role?
Multiple Choice
Options: Very satisfied, Satisfied, Neutral, Dissatisfied, Very dissatisfied
Drag to reorder
- Q2** Do you feel your work is valued by the organization?
Multiple Choice
Options: Always, Most of the time, Sometimes, Rarely, Never
Drag to reorder
- Q3** How would you rate communication within your team?
Multiple Choice
Options: Excellent, Good, Average, Poor, Very poor
Drag to reorder
- Q4** Do you have the tools and resources needed to perform your job effectively?
Multiple Choice
Options: (not fully visible)
Drag to reorder

Each question card has an edit icon (pencil), a delete icon (trash), and a reorder icon (three horizontal lines). A 'Chat wi' button is visible at the bottom right of the interface.

10 Drag to Reorder Questions Section

5.3 Survey Response Handling

The response handling facet of the survey module offers an opportunity to send a response quickly and efficiently. This offers an opportunity to make the responses identified and unidentified depending on the requirements of the survey. There is also a real-time tracking system on the creation of a survey by its creator such that they can monitor the participation in a survey and identify trends from the responses received to help them make proper decisions from the data retrieved.

Furthermore, it has a memory for responding history, as well as the ability to track the process. This means that in any case, an individual can carry on with uncompleted surveys. The auto-save feature, in the course of filling out the surveys, ensures stability without any compromise in the integrity of the data.

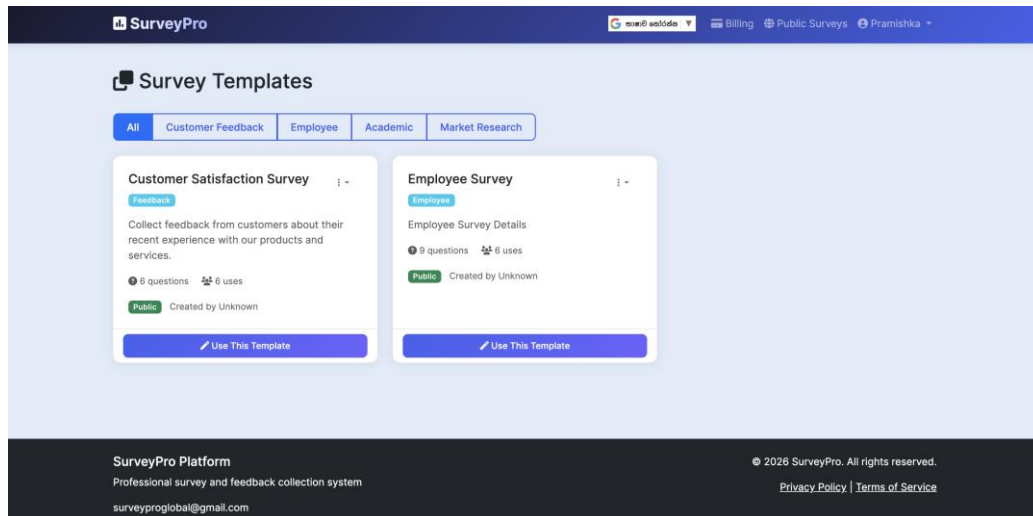

The screenshot displays a SurveyPro survey interface. At the top, a dark blue header contains the SurveyPro logo, a user profile icon, and links for Billing and Public. A green notification bar at the top right indicates 'Progress saved'. The main content area has a light blue background. A progress bar at the top shows 100% completion. Below it, a white box titled 'Payment' contains the text '1 question • Anonymous responses allowed'. The 'Your Information' section follows, with a 'Submit anonymously' option and a note that responses will be recorded without personal identification. It includes optional text input fields for 'Your Name' (containing 'PK1') and 'Your Email' (containing 'pramishkakannangara@gmail.com'). The next section is a question 'G1 Are ready to make the payment' with a required field indicator. It features a horizontal slider from 1 (Poor) to 10 (Excellent), with a blue dot positioned at 5. A red asterisk indicates this question is required. At the bottom, a light blue bar contains the instruction 'Make sure all required questions are answered before submitting.' and a 'Chat with us' button with a speech bubble icon.

11 Survey View with Auto Save feature

5.4 Survey Templates

Survey templates offer users a structure that one can use to create surveys in a quick and efficient manner. The templates may be provided with a range of question types and configuration options, which one can modify according to requirements. This is a good function that helps one avoid wastage of time and enables the best approaches to surveying.

It can be used for personal, public, or organizational use. Hence, it is an efficient tool for both personal and organizational use. The provision of ready-to-use templates also ensures that the system creates a uniform user experience.

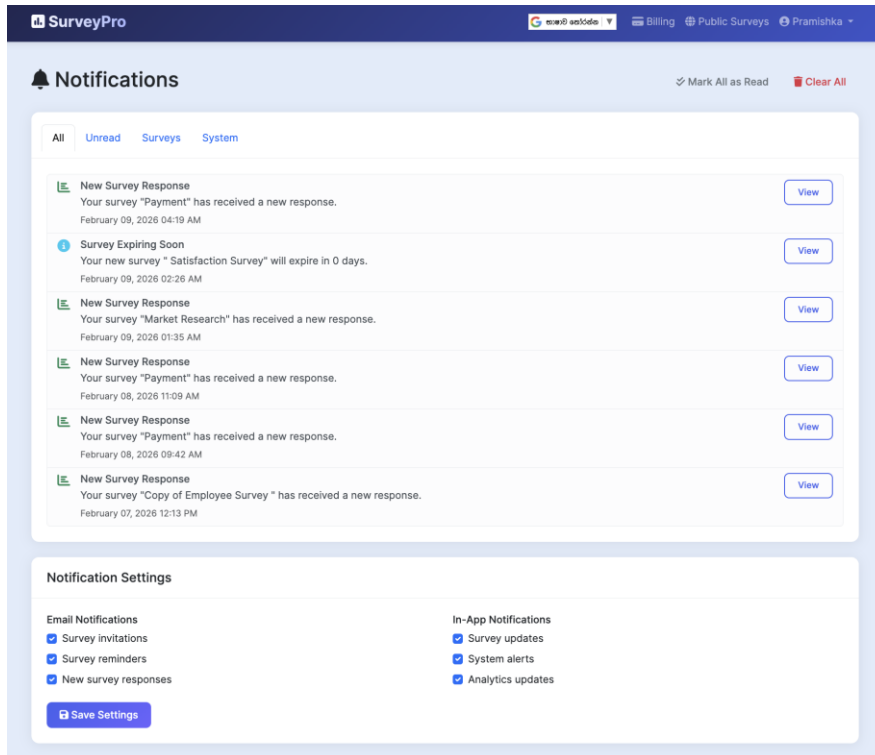

12 Template Selection Page

5.5 Notifications System

The notifications system helps inform the survey creator and the user of activities related to the survey. For instance, one is notified of new survey invitations, responses, reminders, and system notices through access via the app or through emails. This helps one avoid missing important events related to the survey.

The notifications, being flexible as such, offer a chance to filter, read, or clear the notifications as one requires. The automated notifications assist in efficient communication, which might be helpful in improving efficiency in the survey.

13 Notification Page

5.6 Billing and Subscription Management

Billing and Subscriptions can be defined as a surveying feature provided by the platform, which enables users to access different capabilities based on the plan that they have chosen. Normally, every user is permitted to create free surveys reaching a maximum of five. However, after reaching this point, the user is prompted to select a paid plan for the purpose of creating more surveys.

The system also has an automated billing system. This creates bills for subscribed plans, which are then sent to users via email. Users are given an overview of their current subscription status and other information through a specific billing system. Other interactive features in this system allow users to change or downgrade their subscribed plans, remove their subscriptions, and even track limits in real time. All this helps users to be transparent and makes it easy to manage all payment systems and subscription information.

6. Survey Access & Invitation Mechanisms

The platform also facilitates flexibility when it comes to accessing the surveys carried out on it. There are several ways in which this access can be controlled. On the other hand, private surveys are sent through emails in the form of invites to specific individuals only. These emails contain tokens to ensure that only authorized individuals are able to access them. The tokens are meant for verifying the identity of individuals.

Invitation token management stands for the life cycle of an invitation that includes creation, invitation distribution, and usage of invitations. The system also provides real-time invitation status tracking; it allows survey creators to check the participants who viewed, responded, or not yet accessed the survey.

Public surveys can be shared by unique, sharable links, enabling any person with the link to respond. Depending on the privacy setting of the survey, anonymous response settings are options that may be configured and may require the log-in of the participant. These flexibilities ensure surveys can become both secure and accessible, serving a range of research and engagement needs.

7. Automation and Dynamic Features

The system features an auto-save function that saves incomplete survey responses momentarily as the participants fill out the form. In this way, any lost of data due to malfunctioning browsers or being swept away to other pages is avoided. Further, this system can be used in conjunction with a survey timer and a completion tracking system that can track the respondents' progress on how much of the survey they have responded to, the time taken to complete the survey, and a seamless end without any manual input.

To support these background procedures, the system uses scheduled jobs to execute operations in the background at set intervals. This includes checking whether surveys are near expiration and sending reminders. Utilizing these procedures within the background further assists the general efficiency and responsiveness of the system without necessarily involving user interaction.

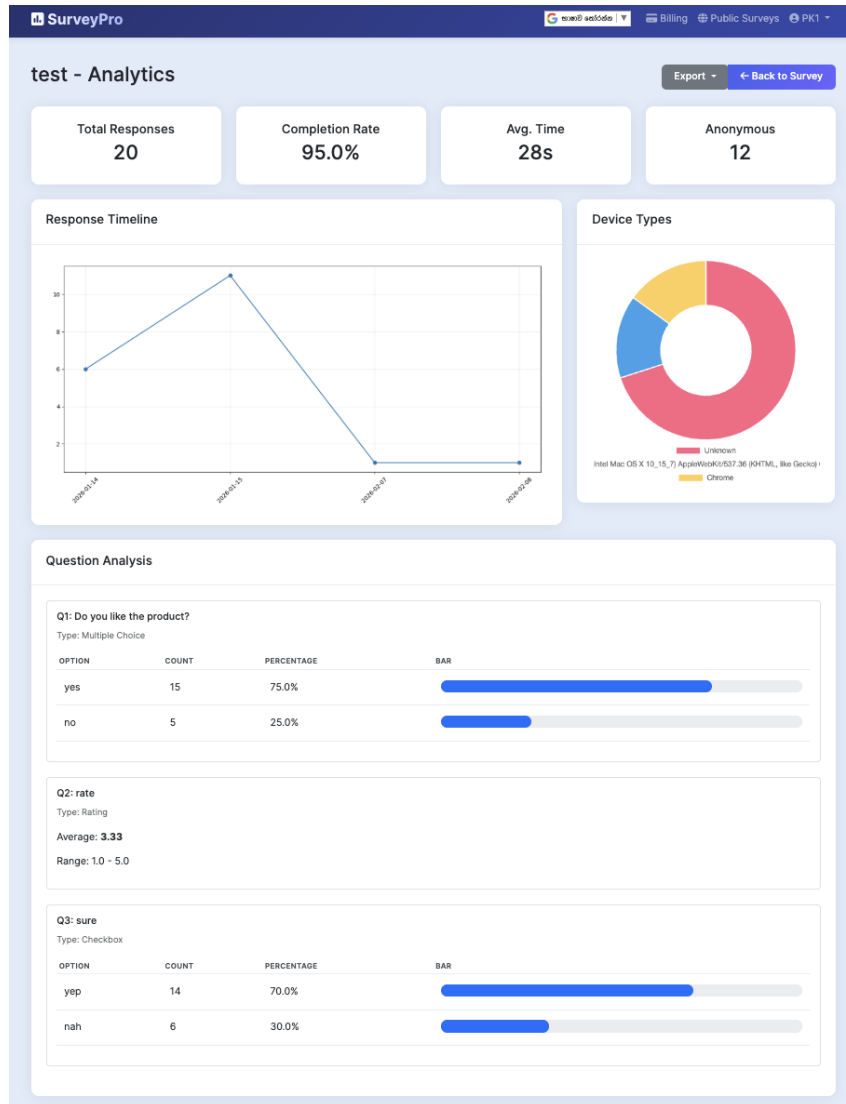

Automated email dispatching as well as real-time analytics refresh help increase interactivity in the online survey software. Emails can be dispatched in real-time for invitations, password reset, reminders, as well as invoices, which means users do not have to do it manually. At the same time, users can be presented with real-time analytics, which gives information concerning new feedback as well as trends in survey feedback, among others. Features such as dynamic questions help in ensuring flexibility in real-time with regard to survey questions, which can be hidden or shown depending on responses received from participants.

8. Analytics and Reporting

It offers a powerful and detailed feature of a real-time analytics system. This gives the creators of the surveys a clear view of the responses to their respective surveys. They are presented in a real-time manner, which includes the total, completion, average, as well as the trends. When we refer to a clear view, we are talking about a comprehensive understanding.

In addition to these, to make the process of interpreting the data provided easier, visualization tools such as bar charts, pie charts, and line graphs have been incorporated within the dashboard. These tools assist the content creator in identifying the trends and patterns associated with the data provided related to queries, demographic data, devices, and other critical considerations just by glancing through the data provided.

The system will be able to monitor survey metrics like response rates and even participant engagements; hence, users will be able to draw some useful insights about survey enhancements. Furthermore, users will be able to export all the data in different formats like CSV, Excel, and PDF; hence, data sharing will be possible with the help of reporting tools and other presentational tools.

19 Analytics Page with Report Export Funtion

9. User Management

The platform must offer a user management system through which the administrator can manage the pool of users and maintain it securely. It is also important that the roles and permissions of users be defined in such a way that it is easy for a standard user and an administrator to maintain it clearly. In this model, it is ensured that each user is offered certain privileges, like creating and managing his/her own surveys as the standard user, and is allowed to perform any action on any other user's resources as the administrator.

21 Profile Page

The system also contains password reset through email link to increase user account security and convenience. This minimizes situations where users will seek assistance from system administrators to reset their passwords. Besides this, the system will allow users to activate or deactivate their accounts. This feature can be useful to the administrators because some users may be inactive or pose potential security threats in some areas.

10. Additional System Features

The website provides a multi-language facility via Google Translate integration, enabling a survey to be displayed in any of the supported languages along with system interface support. This ensures maximum accessibility to any participant of the survey by providing different languages for interaction.

23 Multi Language Support

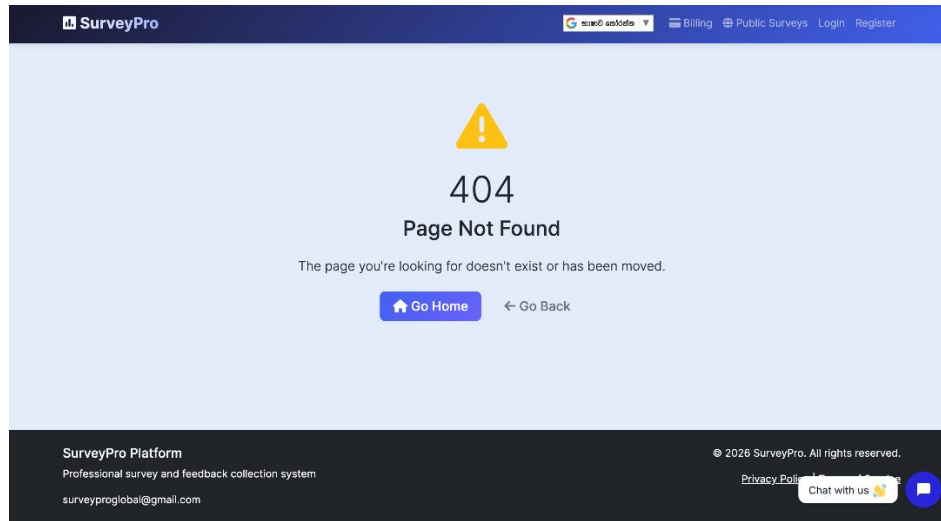

It also contains an AI chatbot that helps in user interface as well as survey creation and analysis. The chatbot enhances user experience through immediate interaction and help without the need for direct human interaction.

24 AI Chat BOT

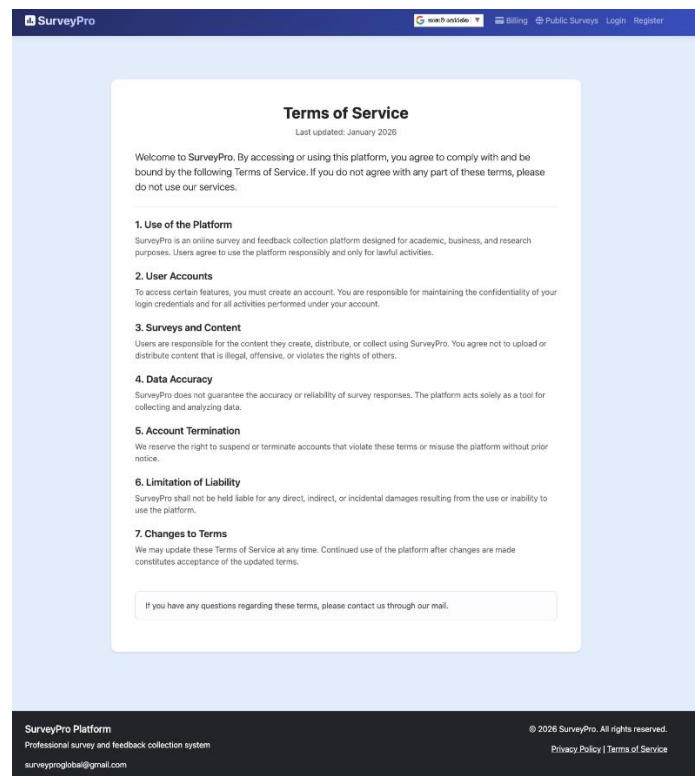

The system utilizes a friendly user interface that makes it compatible with different electronic devices like computers and even tablets. The design of the interface can support different sizes of screens.

Error Handling and Validation: The entire platform has these functionalities incorporated. There are error messages that inform users about incorrect information filled, submission failure, and errors, among others.

25 404 Page

Finally, UI feedback and animation can be used for enhancing various features related to interactivity and engagement. This will include various features such as showing progress bars, show notifications, showing confetti after completing a survey, etc.

26 Terms and Condition Page

11. Conclusion

Conclusively, it can be stated that the platform of SurveyPro has the ability to allow a user to create and conduct a survey in an extensive manner, which is flexible and easily accessible to a user. Considering the presence of multiple elements within the platform, it can be stated that the user can expect elevated degrees of access, interaction, and efficiency. Considering the presence of the NoSQL database, the user can expect elevated degrees of scalability and adaptability in general; therefore, it has become essential for the organization to use the platform.
